

DETECTION AND CLASSIFICATION OF ROAD DAMAGE USING R-CNN AND FASTER R-CNN: A DEEP LEARNING APPROACH

As monitoring roads manually in cities is time-consuming and requires lots of labor, the authors of this paper proposed a model using R-CNN and Faster R-CNN to identify road damages. In this model, 1100 images were resized and labelled with potholes, crack, etc. and ran through R-CNN and Faster R-CNN for training. Here R-CNN built a massive integrated RPN and Faster R-CNN with mutual convolutional feature levels or feature maps. ReLU activation function is implied between the convolutional and pooling layers. Adam Optimizer was used to minimize the loss. In this paper, Faster R-CNN worked better than R-CNN with an accuracy of 98.02% and validation accuracy of 99.80%, where R-CNN got the accuracy and validation accuracy of 71.44% and 76.01%.

In our proposed method, the use of Mask R-CNN extents Faster R-CNN for pixel-level segmentation. It is quite obvious that Mask R-CNN is better than Faster R-CNN, and it also serves the purpose of our proposed method by doing instance segmentation.
